SAFETY INSTRUCTIONS

This chapter contains important safety instructions that you must follow during operation and storage. Read the following before any operation to insure your safety and to keep the instrument in the best possible condition.

Safety Symbols

These safety symbols may appear in this manual or on the instrument.

| WARNING | Warning: Identifies conditions or practices that could result in injury or loss of life. |
|----------------|--|
| | Caution: Identifies conditions or practices that could result in damage to the PSW-Multi or to other properties. |
| <u>Å</u> | DANGER High Voltage |
| <u>À</u> | Attention Refer to the Manual |
| | Protective Conductor Terminal |
| \overline{H} | Earth (ground) Terminal |

Do not dispose electronic equipment as unsorted municipal waste. Please use a separate collection facility or contact the supplier from which this instrument was purchased.

Safety Guidelines

| Do not place any heavy object on the PSW- Multi. |
|--|
| Avoid severe impact or rough handling that leads to damaging the PSW-Multi. |
| • Do not discharge static electricity to the PSW- Multi. |
| • Use only mating connectors, not bare wires, for the terminals. |
| • Do not block the cooling fan opening. |
| • Do not disassemble the PSW-Multi unless you are qualified. |
| • AC Input voltage rating: 100Vac-240Vac +/-10% |
| • Frequency: 47Hz~63Hz |
| • To avoid electrical shock connect the protective grounding conductor of the AC power cord to an earth ground. |
| • Disconnect the power cord before cleaning. |
| • Use a soft cloth dampened in a solution of mild detergent and water. Do not spray any liquid. |
| • Do not use chemicals containing harsh material such as benzene, toluene, xylene, and acetone. |
| Location: Indoor, no direct sunlight, dust free, almost non-conductive pollution (Note below) Relative Humidity: 20%~ 85% Altitude: < 2000m |
| |

| | • Temperature: 0°C to 50°C |
|-------------|---|
| | Mains supply voltage fluctuations: +/-10 % |
| | Overvoltage category: OVC II |
| | • If the equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired. |
| | LAN, RS232/RS485, USB, and GPIB ports are only to be connected to the circuits which are separated from mains supply by double / reinforce insulation. |
| | (Pollution Degree) EN 61010-1 and EN 61010-2-030 specify the pollution degrees and their requirements as follows. The PSW falls under degree 2. |
| | Pollution refers to "addition of foreign matter, solid, liquid, or gaseous (ionized gases), that may produce a reduction of dielectric strength or surface resistivity". |
| | Pollution degree 1: No pollution or only dry, non-conductive pollution occurs. The pollution has no influence. |
| | Pollution degree 2: Normally only non-conductive pollution occurs. Occasionally, however, a temporary conductivity caused by condensation must be expected. |
| | Pollution degree 3: Conductive pollution occurs, or dry, non- conductive pollution occurs which becomes conductive due to condensation which is expected. In such conditions, equipment is normally protected against exposure to direct sunlight, precipitation, and full wind pressure, but neither temperature nor humidity is controlled. |
| Storage | Location: Indoor |
| environment | • Temperature: -25°C to 70°C |
| | • Relative Humidity: <90%, no condensation |
| Disposal | Do not dispose this instrument as unsorted municipal waste. Please use a separate collection facility or contact the supplier from which this instrument was purchased. Please make sure discarded electrical waste is properly recycled to reduce environmental impact. |

All hazardous wiring must be immediately destroyed and replaced in accordance to the above standard.

GETTING STARTED

This chapter describes the power supply in a nutshell, including its main features and front / rear panel introduction. After going through the overview, please read the theory of operation to become familiar with the operating modes, protection modes and other safety considerations.

PSW-Multi Series Overview

Series lineup

The PSW-Multi series consists of 37 models divided into 2 output terminal type (Busbar and connector type) with 2 different size model types (PSW-720 and PSW-1080). The PSW-720 is 2 channel output type and PSW-1080 is 3 channel output type. The models of busbar output type are PSW 30, PSW 40, PSW 80 and PSW160 and connector type are PSW 250 and PSW 800.

Throughout the user manual, PSW 30, PSW 40, PSW 80, PSW 160, PSW 250, PSW 800 will refer to any of the PSW models with a maximum voltage rating of 30V, 40V, 80V, 160V, 250V or 800V, respectively.

Each channel of PSW-Multi series doesn't support serial or parallel operation.

Dual Channel model

³ USB B port

4 Analog Control Connector Standard 26 pin MIL connector (OMRON XG4 IDC plug).

The analog control connector is used to monitor current and voltage output, machine status (OVP, OCP, OHP (OTP) etc.), and for analog control of the

current and voltage output. Use an OMRON XG5 IDC

socket as the mating socket.

5 Fans

Temperature controlled fans

6 Line Voltage Input (PSW-720)

Line Voltage Input (PSW-1080)

- Voltage Input: 100~240 VAC
- Line frequency: 50Hz/60 Hz (Automatically switchable)
 - Voltage Input: 100~240 VAC
 - Line frequency: 50Hz/60 Hz (Automatically switchable)

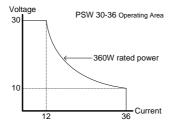

Theory of Operation

The theory of operation chapter describes the basic principles of operation, protection modes and important considerations that must be taken into account before use.

Operating Area Description

Background The PSW power supplies are regulated DC power supplies with a high voltage and current output. These operate in CC or CV mode within a wide operating range limited only by the output power.

> The operating area of each power supply is determined by the rated output power as well as the voltage and current rating. For example the operating area and rated power output for the PSW 30-36 is shown below.

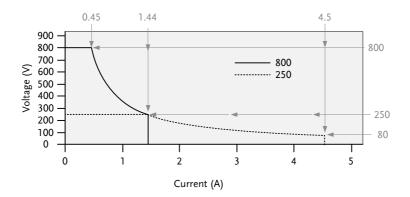

When the power supply is configured so that the total output (current x voltage output) is less than the rated power output, the power supply functions as a typical constant current, constant voltage power supply.

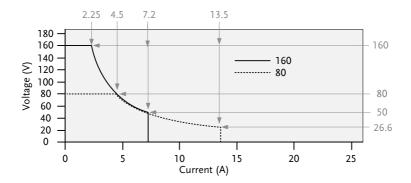

If however, the power supply is configured such that the total output (current x voltage output) exceeds the rated power output, the effective output is actually limited to the power limit of the unit. In this case the output current and voltage then depend purely on the load value.

Below is a comparison of the operating areas of each power supply.

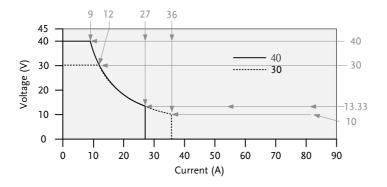

PSW-Multi 80V, 160V Operating Area

PSW-Multi 30, 40V Operating Area

CC and CV Mode

CC and CV mode When the power supply is operating in constant current mode (CC) a constant current will be supplied to the load. When in constant current mode the voltage output can vary, whilst the current remains constant. When the load resistance increases to the point where the current limit (I_{SET}) can no longer be sustained the power supply switches to CV mode. The point where the power supply switches modes is the crossover point.

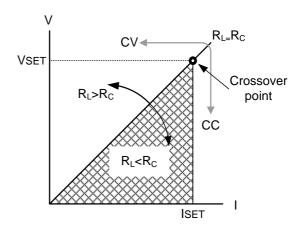

When the power supply is operating in CV mode, a constant voltage will be supplied to the load, whilst the current will vary as the load varies. At the point that the load resistance is too low to maintain a constant voltage, the power supply will switch to CC mode and maintain the set current limit.

The conditions that determine whether the power supply operates in CC or CV mode depends on the set current (I_{SET}), the set voltage (V_{SET}), the load

G≝INSTEK

resistance (R_L) and the critical resistance (R_C). The critical resistance is determined by V_{SET}/I_{SET} . The power supply will operate in CV mode when the load resistance is greater than the critical resistance. This means that the voltage output will be equal to the V_{SET} voltage but the current will be less than I_{SET} . If the load resistance is reduced to the point that the current output reaches the I_{SET} level, the power supply switches to CC mode.

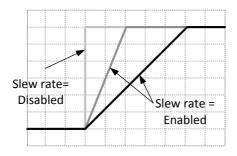

Conversely the power supply will operate in CC mode when the load resistance is less than the critical resistance. In CC mode the current output is equal to I_{SET} and the voltage output is less than V_{SET} .

Slew Rate

Theory

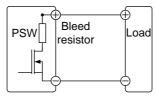

The PSW has selectable slew rates for CC and CV mode. This gives the PSW power supply the ability to limit the current/voltage draw of the power supply. Slew rate settings are divided into High Speed Priority and Slew Rate Priority. High Speed Priority mode disables slew rate settings for CC or CV mode. Slew Rate Priority mode allows for user adjustable slew rates for CC or CV mode. The rising and falling slew rate can be set independently.

Bleeder Control

Background

The PSW DC power supplies employ a bleed resistor in parallel with the output terminals.

Bleed resistors are designed to dissipate the power from the power supply filter capacitors when power is turned off and the load is

| disconnected. Without a bleed resistor, power may remain charged on the filter capacitors for some time and be potentially hazardous. |
|--|
| In addition, bleed resistors also allow for smoother voltage regulation of the power supply as the bleed resistor acts as a minimum voltage load. |
| The bleed resistance can be turned on or off |

using the configuration settings.

By default the bleed resistance is on. For battery charging applications, be sure to turn the bleed resistance off as the bleed resistor can discharge the connected battery when the unit is off.

Sink Current Table

Background Sink current (reference value) from an external voltage source according to the bleeder circuit setting.

Internal Resistance

| Background | On the PSW, the internal resistance of the power supply can be user-defined in software. (Internal Resistance Setting, page 85). When the internal resistance is set it can be seen as a resistance in series with the positive output terminal. This allows the power supply to simulate power sources that have internal resistances such as lead acid batteries. | |
|------------------------------|--|--|
| Internal Resistance Range | Unit Model PSW 30-36 PSW 40-27 PSW 80-13.5 PSW 160-7.2 PSW 250-4.5 PSW 800-1.44 | Internal Resistance Range $0.000 \sim 0.833\Omega$ $0.000 \sim 1.481\Omega$ $0.000 \sim 5.926\Omega$ $0.000 \sim 22.222\Omega$ $0.000 \sim 55.55\Omega$ $0.0 \sim 555.5\Omega$ |

Alarms

The PSW power supplies have a number of protection features. When one of the protection alarms are set, the ALM icon on the display will be lit. For details on how to set the protection modes, please see page 61.

| OVP | Overvoltage protection (OVP) prevents a high voltage from damaging the load. |
|-------------------|---|
| OCP | Overcurrent protection prevents high current from damaging the load. |
| онр (отр) | Overheat (Over temperature) protection protects the instrument from overheating. |
| Power Switch Trip | When the Power Switch Trip configuration setting is enabled, the power supply will automatically shut down when a protection setting has been tripped (OCP, OVP, OHP (OTP)). |
| Alarm output | Alarms are output via the analog control connector. The alarm output is an isolated open- collector photo coupler output. |

Considerations

The following situations should be taken into consideration when using the power supply.

| Inrush current | When the power supply switch is first turned on, |
|----------------|--|
| | an inrush current is generated. Ensure there is |
| | enough power available for the power supply |
| | when first turned on, especially if a number of |
| | units are turned on at the same time. |

| Caution | Cycling the power on and off quickly can cause the inrush current limiting circuit to fail as well as reduce the working life of the input fuse and power switch. | | | | |
|---------------------------|---|---|--|--|--|
| Pulsed or Peaked loads | possible for the mean current ammeter only which means current can ex- pulsed loads, or a power su- be chosen. As exceed the cu | When the load has current peaks or is pulsed, it is possible for the maximum current to exceed the mean current value. The PSW power supply ammeter only indicates mean current values, which means for pulsed current loads, the actual current can exceed the indicated value. For pulsed loads, the current limit must be increased, or a power supply with a greater capacity must be chosen. As shown below, a pulsed load may exceed the current limit and the indicated current on the power supply ammeter. | | | |
| | Current limit level Measured Ammeter current | | | | |

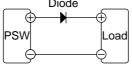

Reverse Current:

When the power supply is connected to a Regenerative load regenerative load such as a transformer or inverter, reverse current will feed back to the power supply. The PSW power supply cannot absorb reverse current. For loads that create reverse current, connect a resistor in parallel (dummy load) to the power supply to bypass the reverse current.

> To calculate the resistance for the dummy resistor, R_D, first determine the maximum reverse current, I_R, and determine what the output voltage, Eo, will be.

| | PSW R _D E _O Load I _R | | |
|---|--|--|--|
| Note Note | The current output will decrease by the amount of current absorbed by the dummy resistor. | | |
| | Ensure the resistor used can withstand the power capacity of the power supply/load. | | |
| Reverse Current: Accumulative energy. | When the power supply is connected to a load such as a battery, reverse current may flow back to the power supply. To prevent damage to the power supply, use a reverse-current-protection diode in series between the power supply and load. | | |
| | Diode | | |

 $R_D(\Omega) \le E_O(V) \div I_R(A)$

Ensure the reverse withstand voltage of the diode is able to withstand 2 times the rated output voltage of the power supply and the forward current capacity can withstand 3 to 10 times the rated output current of the power supply.

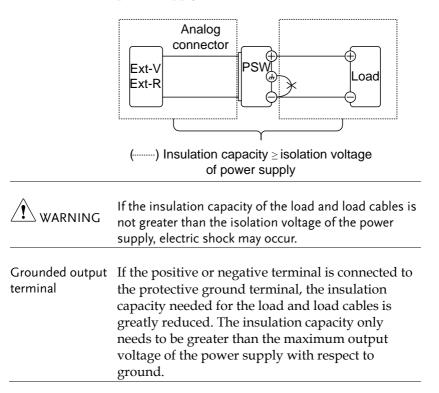

Ensure the diode is able to withstand the heat generated in the following scenarios.

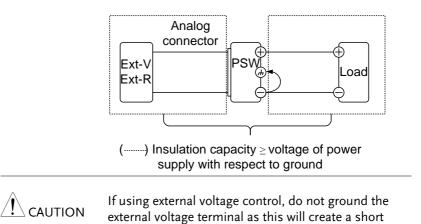

When the diode is used to limit reverse voltage, remote sensing cannot be used.

Grounding

The output terminals of the PSW power supplies are isolated with respect to the protective grounding terminal. The insulation capacity of the load, the load cables and other connected devices must be taken into consideration when connected to the protective ground or when floating.

Floating As the output terminals are floating, the load and all load cables must have an insulation capacity that is greater than the isolation voltage of the power supply.

circuit.

Set Up

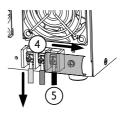

Line Voltage Connection – PSW-1080 Models

| Background | The PSW-1080 models use a universal power input that can be used with 100 and 200 VAC systems. To connect or replace the power cord (GW Instek part number: 4320-91001101, use the procedure below: | | |
|------------|---|---------------------|--|
| Warning | The following procedure should competent persons. Ensure the AC power cord is not | | |
| | Ensure the AC power cord is not | connected to power. | |
| Removal | 1. Turn off the power switch. | | |
| | 2. Unscrew the power cord protective sheath. | | |
| | 3. Remove the 2 screws holding the power cord cover and remove. | 2 | |

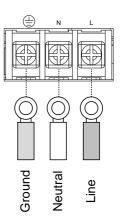

G≝INSTEK

Installation

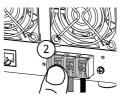

- 4. Slide the cover off the AC terminals.
- 5. Remove the AC power cord wires.

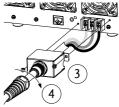

- Connect the AC power cord wires to the AC input terminals.
 - White/Blue \rightarrow Neutral (N)
 - Green/Greenyellow→GND ((=))
 - Black/Brown \rightarrow Line (L)

- 2. Set the cover back over the AC terminals.
- 3. Re-install the power cord cover.
- 4. Screw the power cord sheath back onto the cover.

Filter Installation

| Background | he PSW has a small filter (GW Instek part umber, 57RG-30B001X1) that must first be userted under the control panel before operation. he small filter must be inserted for all model upes. | | |
|------------|--|--|--|
| Steps | Insert the small filter in the open area under the control panel. | | |
| | 2. The unit is now ready to power up. | | |
| Power Up | | | |
| Steps | 1. PSW-720: Connect the power cord to the rear panel socket. | | |
| | PSW-1080: Connect the Page 43 power cord to the universal power input. | | |
| | Press the POWER key. If used for the first time, the default settings will appear on the display, otherwise The PSW recovers the state right before the power was last turned OFF. For default configuration settings, see page 143. | | |

The power supply takes around 8 seconds to fully turn on and shutdown.

Do not turn the power on and off quickly. Please wait for the display to fully turn off.

Wire Gauge Considerations

Background Before connecting the output terminals to a load, the wire gauge of the cables should be considered.

It is essential that the current capacity of the load cables is adequate. The rating of the cables must equal or exceed the maximum current rated output of the instrument.

| Recommended wire gauge | Wire Gauge | Nominal Cross Section | Maximum Current |
|---------------------------|------------|--------------------------|--------------------|
| | 20 | 0.5 | 9 |
| | 18 | 0.75 | 11 |
| | 18 | 1 | 13 |
| | 16 | 1.5 | 18 |
| | 14 | 2.5 | 24 |
| | 12 | 4 | 34 |
| | 10 | 6 | 45 |
| | 8 | 10 | 64 |
| | 6 | 16 | 88 |
| | 4 | 25 | 120 |
| | 2 | 32 | 145 |
| | 1 | 50 | 190 |
| | 0 | 70 | 240 |
| | 0 | 95 | 290 |
| | 0 | 120 | 340 |

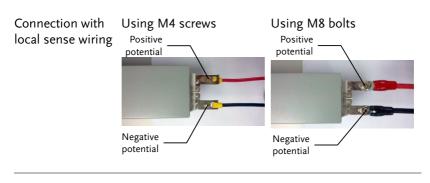

The maximum temperature rise can only be 60 degrees above the ambient temperature. The ambient temperature must be less than 30 deg.

Output Terminals PSW 30/40/80/160

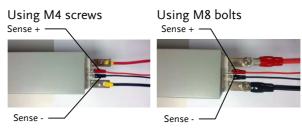

| Background | Before connecting the output terminals to the load, first consider whether voltage sense will be used, the gauge of the cable wiring and the withstand voltage of the cables and load. | | | |
|------------|---|--|--|--|
| | The output terminals can be connected to load cables using M4 sized screws or M8 sized bolts. | | | |
| WARNING | Dangerous voltages. Ensure that the power to the instrument is disabled before handling the power supply output terminals. Failing to do so may lead to electric shock. | | | |
| Steps | 1. Turn the power switch off. | | | |
| | 2. Remove the output terminal cover. Page 49 | | | |
| | 3. If necessary, screw the chassis Page 40 ground terminal to either the positive or negative terminal. See the grounding chapter for details. | | | |
| | Ground Sense joining plates | | | |

4. Choose a suitable wire gauge for Page 46 the load cables.

- 5. Choose a suitable crimp for the terminals.
- 6. If using voltage sense, remove the Page 70 sense terminal joining plates and connect sensing wires to the load(s).
- 7. Connect the positive load cable to the positive output terminal and the negative cable to the negative output terminal.
- 8. Reattach the output terminal Page 49 cover.

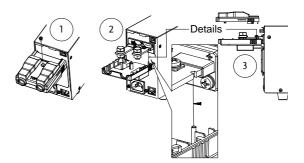

Connection with voltage sense wiring

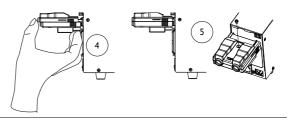

Using the Output Terminal Cover PSW 30/40/80/160

Steps 1. Remove the screw holding the top cover to the bottom cover.

- 2. Line-up the bottom cover with the notches in the output terminals.
- 3. Place the top terminal cover over the bottom cover.

- 4. Use your thumb to slide the terminal covers shut, as shown in the diagram below.
- 5. When the top and bottom covers are flush, reinsert the screw that was removed in step 1.

Removal Reverse the procedure to remove the terminal covers.

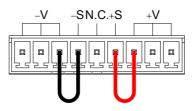

Output Terminals PSW 250/800

| Background | The high voltage models (PSW 250 and PSW 800 models) use a 9 pin socket for the output voltage and sense connections. The corresponding plugs (GW part number PSW-012 //DECA SwitchLab MC420-38109Z) should be used to connect the terminals to the appropriate cable. | | | |
|------------------------------|--|-------------------|--|--|
| | Before connecting the output terminals to the load, first consider whether voltage sense will be used, the gauge of the cable wiring and the withstand voltage of the cables and load. | | | |
| WARNING | Dangerous voltages. Ensure that the power to the instrument is disabled before handling the power supply output terminals. Failing to do so may lead to electric shock. | | | |
| | Please note the wire gauge used and the capacity of the plug/socket. It may be necessary to wire the load to a number of terminals to offset the capacity over a number of terminals. | | | |
| Output Connector Overview | When using the output connector make sure the wires that are used follow the following guidelines: | | | |
| | Wire gauge: | AWG 26 to AWG 16 | | |
| | Strip length | 6.5mm // 0.26 in. | | |
| | Current rating | 10A | | |
| | Insulation resistance | AC 2000V min | | |
| | Insulation withstand voltage | >2000MΩ DC500V | | |
| | Operation Temperature -40°C to +105°C | | | |

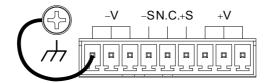

| Output Connector Pinout | -V -S N.C. +S +V | -V: -V terminals (x3) -S: -Sense terminal NC: Not connected +S: +Sense terminal +V: +V terminals (x3) | | |
|------------------------------|--|--|--|--|
| Wiring the Connector Plug | Loosen a a. Tighten c a | Unscrew the appropriate terminal anticlockwise to release the receptacle. | | |
| | b b. | Insert a wire that has had at least ~7mm stripped from the insulation. | | |
| | c. | Tighten the receptacle by screwing clockwise. | | |
| Steps | 1. Turn the power switch o | ff. | | |
| | 2. Remove the output terminal Page 54 cover. | | | |
| | 3. Choose a suitable wire g the load cables. | auge for Page 46 | | |
| | 4. Strip ~7mm from one en | d of each load cable. | | |
| | Connect the positive load +V pins and the negative pins. | | | |

WARNING Please note the wire gauge used and the capacity of the plug/socket. It may be necessary to wire the load to a number of terminals to offset the capacity over a number of terminals.

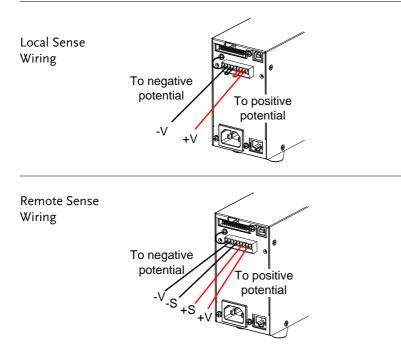

6. If using local sense, connect the -S pin to a -V pin, and connect the +S pin to a +V pin.

- If not using local sense, see the remote sense section to wire the sense terminals for remote sensing.
- 8. If necessary, connect the chassis Page 40 ground terminal to either the -V or +V pin. See the grounding chapter for details.

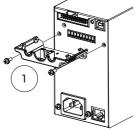

9. Reattach the output terminal Page 54 cover.

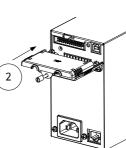

Using the Output Terminal Cover PSW 250/800

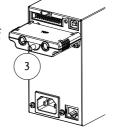

Steps 1. Screw the bottom cover onto the rear panel using the two M4 screws.

2. Slide the top cover over the bottom cover.

3. Finally, secure the top cover with the screw in the center of the top cover.

Removal Reverse the procedure to remove the terminal covers.

Using the Rack Mount Kit

Background The PSW series has an optional Rack Mount Kit (GW Instek part number: [JIS] GRA-410-J, [EIA] GRA-410-E[EIA]) that can be used to hold 6x PSW models, 3x PSW-720 models, 2x PSW-1080 models or a combination of all models (1x PSW, 1x PSW-720 and 1x PSW-1080).

How to Use the Instrument

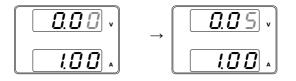

| Background | The PSW power supplies use a novel method of configuring parameter values only using the Voltage or Current knobs. The knobs are used to quickly edit parameter values at 0.01, 0.1 or 1 unit steps at a time. | | |
|------------|--|--|--|
| | When the user manual says to set a value or parameter, use the steps below. | | |
| Example | Use the Voltage knob to set a voltage of 10.05 volts. | | |

 Repeatedly press the Voltage knob until the last digit is highlighted. This will allow the voltage to be edited in 0.01 volt steps.

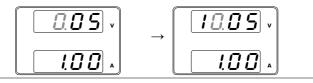

Voltage

- 3. Repeatedly press the Voltage knob until the first digit is highlighted. This will allow the voltage to be edited in 1 volt steps.
- 4. Turn the Voltage knob until 10.05 is shown.

Notice the Set key becomes illuminated when setting the current or voltage.

If the Voltage or Current knobs are unresponsive, press the Set key first.

Reset to Factory Default Settings

| Background | The F-88 configuration setting allows the PSW to be reset back to the factory default settings. See page 143 for the default factory settings. | | | |
|------------|--|---------------|--|--|
| Steps | 1. Press the Function key. The Function key will light up. | Function | | |
| | 2. The display should show F- 01 on the top and the configuration setting for F-01 on the bottom. | - 0 1 0.00 | | |
| | Rotate the Voltage knob to change the F setting to F-88 (Factory Set Value). | Voltage () | | |
| | 4. Use the Current knob to set the F-88 setting to 1 (Return to factory settings). | Current | | |
| | 5. Press the Voltage knob to confirm. ConF will be displayed when successful. | Voltage | | |
| | F-88 Lonf | | | |
| | 6. Press the Function key again to | Function | | |

6. Press the Function key again to exit. The function key light will turn off.

 \bigcirc

View System Version and Build Date

| Background | th ve co | The F-89 configuration setting allows you to view the PSW version number, build date, keyboard ersion, analog-control version, kernel build, test ommand version, test command build date, and the USB driver version. | | |
|------------|----------------|---|---|---|
| Steps | 1. | Press the Function key. The Function key will light up. The display should show F-01 on the top and the configuration setting for F-01 on the bottom. Rotate the Voltage knob to change the F setting to F-89 (Show Version). | | |
| | 2. | | | |

Basic Operation

This section describes the basic operations required to operate the power supply.

- Setting OVP/OCP \rightarrow from page 61
- C.V. mode \rightarrow from page 62
- C.C. mode \rightarrow from page 66
- Display modes \rightarrow page 69
- Panel lock \rightarrow page 70
- Remote sensing \rightarrow from page 70

Before operating the power supply, please see the Getting Started chapter, page 8.

Setting OVP/OCP Levels

| Background | For most models the OVP level has a selectable range of approximately* 10% to 110% of the rated output voltage. Likewise the OCP level for most models has a selectable range of approximately* 10% ~ 110% of the rated output current. The OVP and OCP level is set to the maximum by default. The OCP level can also be turned off. |
|------------|---|
| | *Note that the <i>actual</i> setting range differs for each model. |
| | When one of the protection measures are on, ALM is shown on the panel display. By default, the power switch will turn off when any of the protection levels are tripped. |

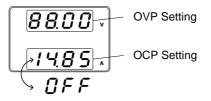

Before setting the OVP or OCP level:

- Ensure the load is not connected.
- Ensure the output is set to off.

| Setting Ranges | | | | | | |
|----------------|----------|----------|------------|-----------|-----------|-------------|
| PSW | 30-36 | 40-27 | 80-13.5 | 160-7.2 | 250-4.5 | 800-1.44 |
| OVP Range (V) | 3-33 | 4-44 | 8-88 | 16-176 | 20-275 | 20-880 |
| OCP Range (A) | 3.6-39.6 | 2.7-29.7 | 1.35-14.85 | 0.72-7.92 | 0.45-4.95 | 0.144-1.584 |

- Steps
 1. Press the OVP/OCP key. The OVP/OCP OVP/OCP key lights up.
 - 2. The OVP setting will be displayed on the top and the OCP setting (or OFF) will be displayed on the bottom.

OVP Level 3. Use the Voltage knob to set the OVP level.

OCP Level 4. Use the Current knob to set the OCP level, or to turn OCP off.

| | 5. Press OVP/OCP again to exit. The OVP/OCP oVP/OCP indicator will turn off. | |
|-----------------------------|---|--|
| Power switch trip | Set F-95 (Power switch trip) to 1 (to Page 98 disable the power switch trip) or to 0 (to enable the power switch trip) and save. | |
| | F-95 1 (Disable) or 0 (Enable) | |
| Clear OVP/OCP protection | The OVP or OCP protection can be cleared after it has been tripped by holding the OVP/OCP button for 2 seconds. (Only applicable when the power switch trip setting is disabled [F-95 = 1]) | |

Set to C.V. Mode

When setting the power supply to constant voltage mode, a current limit must also be set to determine the crossover point. When the current exceeds the crossover point, the mode switches to C.C. mode. For details about C.V. operation, see page 28. C.C. and C.V. mode have two selectable slew rates: High Speed Priority and Slew Rate Priority. High Speed Priority will use the fastest slew rate for the instrument while Slew Rate Priority will use a user-configured slew rate.

| Background | Before setting the power supply to C.V. modeensure:The output is off.The load is connected. | 2, |
|------------|---|----------------------|
| Steps | Function key will light up | |
| | 2. The display should show F- 01 on the top and the configuration setting for F-01 on the bottom. | <i>ו</i> <i>0</i> |
| | 3. Rotate the Voltage knob to change the F setting to F-03 (V-I Mode Slew Rate Select). | oltage ① |
| | 4. Use the Current knob to set the F-03 setting. Set F-03 to 0 (CV High Speed Priority) or 2 (CV Slew Rate Priority). | urrent () |
| | F-03 0 = CV High Speed Priority 2 = CV Slew Rate Priority | |
| | 5. Press the Voltage knob to save the configuration setting. ConF will be displayed when successful. F - O J LonF | Altage |

- If CV Slew Rate Priority was chosen as the operating mode, repeat steps 3~5 to set F-04 (Rising Voltage Slew Rate) and the F-05 (Falling Voltage Slew Rate) and save.
 - $\begin{array}{c} \mbox{F-04 / F-05} & 0.1 \mbox{V/s} \sim 60 \mbox{V/s} \mbox{(PSW 30)} \\ & 0.1 \mbox{V/s} \sim 80 \mbox{V/s} \mbox{(PSW 40)} \\ & 0.1 \mbox{V/s} \sim 160 \mbox{V/s} \mbox{(PSW 80)} \\ & 0.1 \mbox{V/s} \sim 320 \mbox{V/s} \mbox{(PSW 160)} \\ & 0.1 \mbox{V/s} \sim 500.0 \mbox{V/s} \mbox{(PSW 250)} \\ & 1 \mbox{V/s} \sim 1600 \mbox{V/s} \mbox{(PSW 800)} \end{array}$
- 7. Press the Function key again to exit the configuration settings. The function key light will turn off.
- 8. Use the Current knob to set the current limit (crossover point).
- 9. Use the Voltage knob to set the voltage.

Current

Notice the Set key becomes illuminated when setting the current or voltage. If the Voltage or Current knobs are unresponsive, press the Set key first.

10. Press the Output key. The Output key becomes illuminated.

 \bigcirc

CV and the Power Bar will become illuminated (top left & center)

| Note | Only the voltage level can be altered when the output is on. The current level can only be changed by pressing the Set key. |
|------|---|
| | |

For more information on the Normal Function Settings (F-00 ~ F-61, F-88~F-89) see page 87.

Set to C.C. Mode

When setting the power supply to constant current mode, a voltage limit must also be set to determine the crossover point. When the voltage exceeds the crossover point, the mode switches to C.V. mode. For details about C.C. operation, see page 28. C.C. and C.V. mode have two selectable slew rates: High Speed Priority and Slew Rate Priority. High Speed Priority will use the fastest slew rate for the instrument while Slew Rate Priority will use a user-configured slew rate.

| Background | efore setting the power supply to C.C. ode, ensure: The output is off. The load is connected. | |
|------------|---|--|
| Steps | 1. Press the Function key. The Function Function key will light up. | |
| | 2. The display should show F- 01 on the top and the configuration setting for F-01 on the bottom. | |
| | 3. Rotate the Voltage knob to change the F setting to F-03 (V-I Mode Slew Rate Select). | |

Current

4. Use the Current knob to set the F-03 setting.

Set F-03 to 1 (CC High Speed Priority) or 3 (CC Slew Rate Priority) and save.

5. Press the Voltage knob to save the configuration setting. ConF will be displayed when successful.

- 6. If CC Slew Rate Priority was chosen as the operating mode, set F-06 (Rising Current Slew Rate) and F-07 (Falling Current Slew Rate) and save.
 - F-06 / F-07 0.01A/s ~ 72.00A/s (PSW 30-36) 0.01A/s ~ 54.00A/s (PSW 40-27) 0.01A/s ~ 27.00A/s (PSW 80-13.5) 0.01A/s ~ 14.40A/s (PSW 160-7.2) 0.001A/s ~ 9.000A/s (PSW 250-4.5) 0.001A/s ~ 2.880A/s (PSW 800-1.44)
- 7. Press the Function key again to exit the configuration settings. The function key light will turn off.
- 8. Use the Voltage knob to set the voltage limit (crossover point).

9. Use the Current knob to set the current.

Note Notice the Set key becomes illuminated when setting the current or voltage. If the Voltage or Current knobs are unresponsive, press the Set key first.

10. Press the Output key. The Output key becomes illuminated.

CC and the Power Bar will become illuminated (bottom left & center)

Only the current level can be altered when the output is on. The voltage level can only be changed by pressing the Set key.

For more information on the Normal Function Settings (F-00 ~ F-61, F-88~F-89) see page 87.

Display Modes

The PSW power supplies allow you to view the output in three different modes: voltage and current, voltage and power or current and power.

| Steps | 1. Press the PWR/DSPL key. The PWR DSPL key lights up.PWR DSPL | | | |
|-------|---|--|--|--|
| | The display changes to voltage and power (V/W). | | | |
| | To switch between displaying A/W and V/W, simply press the corresponding Voltage or Current knob. | | | |
| | For example: when in A/W mode, press the Voltage knob to display V/W. Conversely when in V/W mode, press the Current knob to display A/W. | | | |
| | S.C.C. v Voltage S w | | | |
| | | | | |
| | • When V/W is displayed, the Voltage knob can still be used to change the voltage level. | | | |
| | • When A/W is displayed, the Current knob can still be used to change the current level. | | | |
| Exit | Press the PWR/DSPL key again to return to normal display mode. The PWR DSPL light will turn off. | | | |

Panel Lock

The panel lock feature prevents settings from being changed accidentally. When activated, the Lock/Local key will become illuminated and all keys and knobs except the Lock/Local key and Output key (if active) will be disabled.

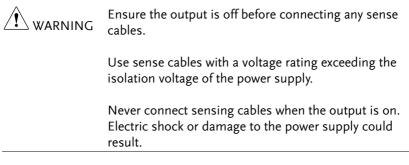

If the instrument is remotely controlled via the USB/LAN interface, the panel lock is automatically enabled.

| Activate the panel lock | Press the Lock/Local key to active the panel lock. The key will become illuminated. | Lock/Local |
|----------------------------|---|------------|
| Disable the panel lock | Hold the Lock/Local key for ~3 seconds to disable the panel lock. The Lock/Local light turns off. | Lock/Local |

Remote Sense

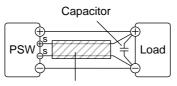

Remote sense is used to compensate for the voltage drop seen across load cables due to the resistance inherent in the load cables. The remote sense terminals are connected to the load terminals to determine the voltage drop across the load cables.

Remote sense can compensate up to 0.6 volts for 30V/40V/80V/160V models and 1V for 250V/800V models (compensation voltage). Load cables should be chosen with a voltage drop less than the compensation voltage.

| Note | Be sure to remove the Sense joining plates so the units are not using local sensing. | | |
|--|---|------------------|---------|
| Single Load | Connect the Sense+ terminal to the positive potential of the load. Connect the Sense- terminal to the negative potential of the load. | | Sense- |
| | PSW | Load –⊕ Input | Page 47 |
| | Output O Sense O Sense O | | |
| | 2. Operate the instru- See the Basic Ope details. | | - |
| Wire Shielding and Load line impedance | To help to minimize the oscillation due to the inductance and capacitance of the load cables, use an electrolytic capacitor in parallel with the load terminals. | | |

To minimize the effect of load line impedance use twisted wire pairing.

Twisted pair

Test Scripts

This section describes how to use the Test function to run, load and save test scripts for automated testing. The Test function is useful if you want to perform a number of tests automatically. The PSW test function can store ten test scripts in memory.

Each test script is programmed in a scripting language. For more information on how to create test scripts, please contact GW Instek.

- Test Script File Format→ from page 73
- Test Script Settings \rightarrow from page 73
- Setting the Test Script Settings \rightarrow from page 74
- Load Test Script \rightarrow from page 75
- Run Test Script (Manually) \rightarrow from page 77
- Run Test Script (Automatically at startup) \rightarrow from page 79
- Export Test Script \rightarrow from page 80
- Remove Test Script \rightarrow from page 81
- Check the Available Memory Capacity \rightarrow from page 82

Test Script File Format

| Background | The test files are saved in *.tst file format. Each file is saved as tXXX.tst, where XXX is the save file number 001~010. | |
|-----------------|--|------------------------------------|
| | | |
| Test Script Set | tings | |
| Test Run | Runs the chosen test script from the internal memory. A script must first be loaded into the internal memory before it can be run. See the t function Test Save, below. | |
| | started. | un as soon as the test function is |
| | T-01 | 1~10 |
| Test Load | Loads a test script from the USB drive to the designated save slot in memory. A script must first be loaded into internal memory before it can be run. | |
| | T-02 | 1~10 (USB→PSW) |
| Test Export | Exports a script from the designated memory save slot to the USB drive. T-03 $1\sim 10$ (PSW \rightarrow USB) | |
| Test Remove | Deletes the chosen test file from the PSW internal memory. | |
| | T-04 | 1~10 |
| Test Memory | Displays the amount of internal memory that is available on the unit in kilobytes (1024 bytes). T-05 Max: 1848 KB | |

Setting the Test Script Settings

| The test script settings (T-01~T-04) are set with the Test key. | | | |
|--|--|--|--|
| 1. Press the Test key. The Test key will Test light up. | | | |
| 2. The display will show T-01 on the top and the memory no. for T-01 on the bottom. The bottom of the screen will also indicate whether the memory no. has a script loaded, "y" (yes) or "n" (no). | | | |
| Script not present I Test Setting Memory number Test Setting | | | |
| Script Memory present I number | | | |
| 3. Rotate the Voltage knob to change the T setting (Test setting). Test Run T-01 Test Load T-02 Test Export T-03 Test Remove T-04 Test Memory T-05 | | | |
| | | | |

4. Rotate the Current knob to choose a memory number.

Range 1~10

- Current ①
- 5. Press the Voltage knob to complete the setting.
- Exit Press the Test key again to exit the Test settings. The Test key light will turn off.

Load Test Script from USB

| Overview | Before a test script can be run, it must first be loaded into a one of the 10 memory save slots. Before loading a test script into memory: | | |
|----------|--|--|--|
| | • Ensure the script file is placed in the root directory. | | |
| | • Ensure the file name number corresponds to the memory number that you wish to save to. | | |
| | For example: A test file named t001.tst can only be saved to memory number 01, t002.tst can only be saved to memory number 02, and so on. | | |
| Steps | 1. Insert a USB flash drive into the front panel USB-A slot. Ensure the flash drive contains a test script in the root directory. | | |

2. Turn on the power. MS (Mass Storage) will be displayed on the screen after a few seconds if the USB drive is recognized.

Note If the USB drive is not recognized, check to see that the function settings for F-20 = 1 (page 91). If not, reinsert the USB flash drive.

3. Configure T-02 (Test Load) to 1~10 Page 74 (save memory slot)

T-02 range 1~10 (t001 ~t010)

4. The script will now be available in the memory slot the script was saved to.

Error messages: If you load a file that is not present on the USB drive "Err 002" will be displayed on the display.

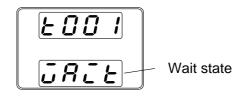

Run Test Script (Manual)

| Overview | A test script can be run from one of ten memory slots. | | | |
|-----------|--|--|--|--|
| Steps | Before a test script can be run, it Page 75 must first be loaded into one of the 10 memory save slots. | | | |
| | Configure T-01 (Run Test) to 1~10 Page 74 (save memory slot#) | | | |
| | T-01 range 1~10 | | | |
| | 3. The loading screen will appear. For example if memory slot #1 is loaded, the following screen will appear. | | | |
| | LoRd | | | |
| Note Note | If the script is very small, the loading screen may not appear on the screen for very long. | | | |
| | When the "t00X Load" screen is shown on the display, pushing the TEST key will abort the loading procedure. | | | |

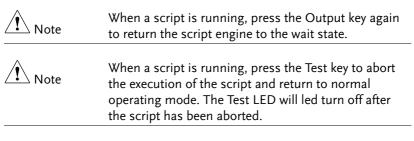

Output

 \bigcirc

4. If there are no errors during loading, the script engine will enter the wait state. The wait state indicates that the unit is ready to execute the script.

- 5. To execute the script, press the Output key. The Output key becomes illuminated.
- When the script is executing, the measurement results will display as normal.
- The Test LED will flash.

Error messages: If you try to run a test script from an empty memory location "Err 003" will be displayed on the display.

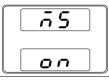

Run Test Script (Automatically at Startup)

| Overview | The power supply can be configured to automatically run a test script at startup. | | | |
|----------|--|--|--|--|
| Steps | Before a test script can be run, it Page 75 must first be loaded into one of the 10 memory save slots. | | | |
| | 2. Turn the unit off. | | | |
| | Enter the power-on configuration Page 98 settings and set F-92 (Power-ON Output) to run the desired test script. | | | |
| | Range T001~T010* | | | |
| | 4. The selected test script will automatically start to run the next time the unit is powered on. | | | |
| Note | *Setting F-92 to 0 or 1 will disable loading a test script at startup. 0 will turn the output off at startup. 1 will turn the output on at startup. See the power on configuration settings for details, page 94. | | | |
| Note | When a script is running, press the Output key to pause the script. To resume the script, press the Output key again. | | | |

Export Test Script to USB

| Overview | The Export Test function saves a test file to the root directory of a USB flash drive. |
|----------|--|
| | • Files will be saved as tXXX.tst where XXX is the memory number 001~010 from which the test script was exported from. |
| | • Files of the same name on the USB flash drive will be written over. |
| Steps | 1. Insert a USB flash drive into the front panel USB-A slot. |
| | |

2. Turn on the power. MS (Mass Storage) will be displayed on the screen after a few seconds if the USB drive is recognized.

| Note Note | If the USB drive is not recognized, check to see that the function settings for F-20 = 1 (page 91). If not, reinsert the USB flash drive. | | | | |
|-----------|---|--|--|--|--|
| | 3. Configure T-03 (Test Export) to Page 74 0~10 (save memory slot) | | | | |
| | T-03 range 1~10 | | | | |
| | 4. The script will now be copied to the USB flash drive. | | | | |

Error messages: If you try to export a test script from an empty memory location "Err 003" will be displayed on the display.

Remove Test Script

| Overview | The Remove Test function will delete a test script from the internal memory. | | | |
|----------|---|--|--|--|
| Steps | Select T-04 (Test Remove) and Page 74 choose which test script to remove from the internal memory. | | | |
| | T-04 range $1 \sim 10$ | | | |
| | 2. The test script will be removed from the internal memory. | | | |
| Note | Error messages: If you try to remove a test script fror an empty memory location "Err 003" will be displaye on the display. | | | |
| | | | | |

Checking the Available Memory

| Overview | The T-05 function displays the amount of internal memory that is left on the unit to load test scripts. The displayed units are in kilobytes (1024 bytes). | |
|----------|--|---------|
| Steps | Select T-05 (Test Memory). The available memory in kilobytes is displayed. | Page 74 |
| | T-05 range 1~1848 KB | |

CONFIGURATION

| Configuration | 84 |
|---|----|
| Configuration Table | |
| Normal Function Settings | |
| USB/GPIB Settings* | |
| LAN Settings* | |
| System Settings | |
| Power On Configuration Settings | 95 |
| Multi-Channel Function Setting | |
| Calibration | |
| Setting Normal Function Settings | |
| Setting Power On Configuration Settings | |

Configuration

Configuration of the PSW power supplies is divided into six different configuration settings: Normal Function, USB/ GPIB/ RS232, LAN, Power ON Configuration, Calibration Setting, Multichannel Function setting and System settings. Power ON Configuration differs from the other settings in that the settings used with Power ON Configuration settings can only be set during power up. The other configuration settings can be changed when the unit is already on. This prevents some important configuration parameters from being changed inadvertently. Power On Configuration settings are numbered F-90 to F-95 and the other configuration settings are numbered F-00 to F-61, F-71 to F-74, F-88 to F-89 and F130 to F132.

Configuration Table

Please use the configuration settings listed below when applying the configuration settings.

| Normal Function Settings | Setting | Setting Range |
|-----------------------------|---------|-----------------------------|
| Output ON delay time | F-01 | 0.00s~99.99s |
| Output OFF delay time | F-02 | 0.00s~99.99s |
| ; | | 0 = CV high speed priority |
| V I manda algur rata calact | F-03 | 1 = CC high speed priority |
| V-I mode slew rate select | F-U3 | 2 = CV slew rate priority |
| | | 3 = CC slew rate priority |
| Rising voltage slew rate | | 0.01V/s ~ 60.00V/s (PSW 30) |
| | | 0.01V/s ~ 80.00V/s (PSW 40) |
| | F-04 | 0.1V/s ~ 160.0V/s (PSW 80) |
| | | 0.1V/s ~ 320.0V/s (PSW 160) |
| | | 0.1V/s ~ 500.0V/s (PSW 250) |
| | | 1V/s ~ 1600V/s (PSW 800) |
| | F-05 | 0.01V/s ~ 60.00V/s (PSW 30) |
| | | 0.01V/s ~ 80.00V/s (PSW 40) |
| | | 0.1V/s ~ 160.0V/s (PSW 80) |
| Falling voltage slew rate | | 0.1V/s ~ 320.0V/s (PSW 160) |
| | | 0.1V/s ~ 500.0V/s (PSW 250) |
| | | 1V/s ~ 1600V/s (PSW 800) |

| Calibration | F-00 | 0000 ~ 9999 |

Note

^{*1}: Only configure from CH1
^{*2}: Power on configuration settings only can be set during power up.

Enter configuration setting from CH1 and each channel can be used different settings. Under normal operation they only can be viewed.

*3 : Need to be used together with GUR-001 series.

Normal Function Settings

Output ON Delay Delays turning the output on for a designated Time amount of time. The Delay indicator will light when the Delay time is not 0.

Note: The Output ON Delay Time setting has a maximum deviation (error) of 20ms.

The Output ON Delay Time setting is disabled when the output is set to external control.

| Output OFF Delay Time | Delays turning the output off for a designated amount of time. The Delay indicator will light when the Delay time is not 0. |
|--------------------------|---|
| Note | The Output OFF Delay Time setting has a maximum |

deviation (error) of 20ms.

The Output OFF Delay Time setting is disabled when the output is set to external control.

| V-I Mode | Selects High Speed Priority or Slew Rate Priority |
|----------|---|
| | for CV or CC mode. The voltage or current slew |
| | rate can only be edited if CC/CV Slew Rate |
| | Priority is selected. The ISR indicator will be lit for |
| | CC Slew Rate Priority and the VSR indicator will |
| | be lit for CV Slew Rate Priority. |

Note: CC and CV Slew Rate Priority mode are disabled when voltage/current output is set to external control.

Analog Remote Control Overview

The PSW power supply series have a number of analog control options. The Analog Control connectors are used to control output voltage and current using external voltage or resistance. The power supply output and power switch can also be controlled using external switches.

| |

External Voltage Control of Voltage Output

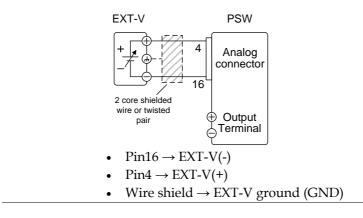

| Background | External voltage control of the voltage output is |
|------------|---|
| | accomplished using the MIL-26 connector on the |
| | rear panel. A voltage of 0~10V is used to control |
| | the full scale voltage of the instrument, where: |
| | |

Output voltage = full scale voltage × (external voltage/10)

Connection When connecting the external voltage source to the MIL connectors, use shielded or twisted paired wiring.

Connection- alt. If the wire shield needs to be grounded at the voltage source (EXT-V), then the shield cannot also be grounded at the negative (-) terminal output of the PSW power supply. This would short the output.

Panel operation 1. Connect the external voltage according to the connection diagrams above.

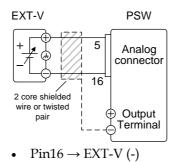

| | 2. Set the F-90 power on Page 98 configuration setting to 1 (CV control – Ext voltage). Be sure to cycle the power after the power on configuration has been set. |
|------|--|
| | 3. Press the Function key and confirm the new configuration settings (F-90=1). |
| | 4. Press the Output key. The voltage output can now be controlled with the External voltage. |
| Note | The input impedance for external voltage control is $10k\Omega$. |
| | Use a stable voltage supply for the external voltage control. |
| Note | CV and CC Slew Rate Priority are disabled for V-I mode (F-03) when using external voltage control. See the normal function settings on page 87. |
| | Ensure no more than 10.5 volts are input into the external voltage input. |
| | Ensure the voltage polarity is correct when connecting the external voltage. |

External Voltage Control of Current Output

Background External voltage control of the current output is accomplished using the MIL-26 connector on the rear panel. A voltage of 0~10V is used to control the full scale current of the instrument, where:

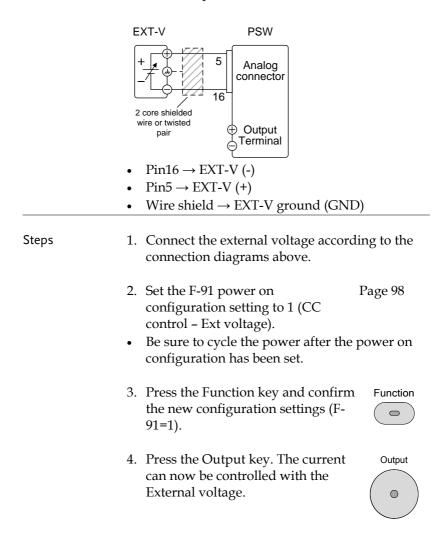

Output current = full scale current × (external voltage/10)

Connection When connecting the external voltage source to the MIL connectors, use shielded or twisted paired wiring.

- $Pin5 \rightarrow EXT-V (+)$
- Wire shield \rightarrow negative (-) output terminal

Connection- alt. If the wire shield needs to be grounded at the shielding voltage source (EXT-V), then the shield cannot also be grounded at the negative (-) terminal output of the PSW power supply. This would short the output.

| Note | The input impedance for external voltage control is 10k Ω_{\cdot} |
|-----------------|---|
| | Use a stable voltage supply for the external voltage control. |
| Note | CV and CC Slew Rate Priority are disabled for V-I mode (F-03) when using external voltage control. See the normal function settings on page 87. |
| | Ensure the voltage polarity is correct when connecting the external voltage. |
| | Ensure no more than 10.5 volts are input into the external voltage input. |
| External Resist | ance Control of Voltage Output |
| Background | External resistance control of the voltage output is |

accomplished using the MIL-26 connector on the rear panel. A resistance of $0k\Omega \sim 10k\Omega$ is used to control the full scale voltage of the instrument.

The output voltage (0 to full scale) can be controlled with the external resistance going up (Ext-R \bowtie) 0k Ω ~10k Ω (10k Ω = Vo,max) or down (Ext-R \bowtie) 10k Ω ~0k Ω (10k Ω = 0).

For $0k\Omega \sim 10k\Omega$: Output voltage = full scale voltage × (external resistance/10)

For $10k\Omega \sim 0k\Omega$: Output voltage = full scale voltage × ([10-external resistance]/10)

| Note | The Ext-R $\$ configuration is recommended for safety reasons. In the event that the cables become accidentally disconnected, the voltage output will drop to zero. Under similar circumstances using Ext-R $\$, an unexpected high voltage would be output. If switches are used to switch between fixed resistances, use switches that avoid creating open circuits. Use short-circuit or continuous resistance switches. |

| | 2. Set the F-90 (CV Control) Page 98 configuration settings to 2 for Ext-R↓ or 3 for Ext-R⊳. Be sure to cycle the power after the power on configuration has been set. |
| | 3. Press the Function key and confirm the new configuration settings (F-90=2 or 3). |

| | Press the Output key. The voltage can now be controlled with the External resistance. | Output |
|------|--|------------|
| Note | Ensure the resistor(s) and cables used exc isolation voltage of the power supply. For e insulation tubes with a withstand voltage h the power supply can be used. | example: |
| | When choosing an external resistor ensure resistor can withstand a high degree of hea | |
| Note | CV and CC Slew Rate Priority are disabled mode (F-03) when using external resistance See the normal function settings on page 8 | e control. |

External Resistance Control of Current Output

| Background | External resistance control of the current output is accomplished using the MIL-26 connector on the rear panel. A resistance of $0k\Omega$ ~ $10k\Omega$ is used to control the full scale current of the instrument. |
|------------|--|
| | The output current (0 to full scale) can be controlled with the external resistance going up (Ext-R \carbondow) $0k\Omega \sim 10k\Omega(10k\Omega = Vo,max)$ or down (Ext-R \carbondow) $10k\Omega \sim 0k\Omega(10k\Omega = 0)$. |
| | For $0k\Omega \sim 10k\Omega$: Output current = full scale current \times (external resistance/10) |
| | For $10k\Omega \sim 0k\Omega$: Output current = full scale current × ([10-external resistance]/10) |

| Note | The Ext-R configuration is recommended for safety reasons. In the event that the cables become accidentally disconnected, the current output will drop to zero. Under similar circumstances using Ext-R \downarrow , an unexpected high current would be output. If switches are used to switch between fixed resistances, use switches that avoid creating open circuits. Use short-circuit or continuous resistance switches. | | |

| | 2. Press the Function key and confirm the new configuration settings (F-91=2 or 3). | | |

| | 3. Press the Output key. The current can now be controlled with the External resistance. |
|------|---|
| Note | Ensure the resistor(s) and cables used exceed the isolation voltage of the power supply. For example: insulation tubes with a withstand voltage higher than the power supply can be used. |
| | When choosing an external resistor ensure the resistor can withstand a high degree of heat. |
| Note | CV and CC Slew Rate Priority are disabled for V-I mode (F-03) when using external resistance control. See the normal function settings on page 87. |

External Control of Output

Background The output can be turned on or off externally using a switch. The analog control connector can be set to turn the output on from a high or low signal. The voltage across pins 2 and 24 are internally pulled to $+5V \pm 5\%$ @ 500uA with 10k Ω pull-up resistor. A short (closed switch) produces a low signal.

When set to High = On, the output is turned on when the pins 2-24 are open.

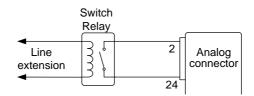

When Low = On, the output is turned on when pins 2-24 are shorted.

| Steps | 1. Connect the external switch according to the connection diagrams above. |
| | Set F-94 (External output logic) in Page 98 the power on configuration settings to 0 (High = On) or 1 (Low = On). Be sure to cycle the power after setting the power on configuration settings. |
| | 2. Press the Function key and confirm the new configuration settings. |
| | 3. The switch is now ready to set the output on o |

3. The switch is now ready to set the output on or off.

| \wedge | |
|----------|--|
| └└Note | |

When using a switch over long distances, please use a switch relay to extend the line from the coil side of the relay.

If a single switch control is to be used for Multiple units, please isolate each instrument. This can be achieved by using a relay.

| Warning | Ensure the cables used and the switch exceed the isolation voltage of the power supply. For example: insulation tubes with a withstand voltage higher than the power supply can be used. | |
|-----------|---|--|
| Note Note | Messages: If F-94 = 0 (High = on) and the pin 24 is low (0) "MSG 001" will be displayed on the display. | |
| | If F-94 = 1 (Low = on) and the pin 24 is high (1) "MSG 002" will be displayed on the display. | |
| | Output off (High=on) Output off (Low=on) | |

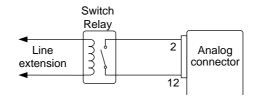

External control of Shutdown

Background The output of the power supplies can be configured to shut down via an external switch. The ability to externally shut down the power supply must first be enabled in the power on configuration settings. The voltage across pins 2 and 12 are internally pulled to $+5V \pm 5\%$ @ 500uA with $10k\Omega$ pull-up resistor.

| Connection | Analog connector | |
| | pair \bigcirc Output | |
| | • $Pin2 \rightarrow Switch$ | |
| | • $Pin12 \rightarrow Switch$ | |
| | • Wire shield \rightarrow negative (-) output terminal | |
| Steps | Connect the external switches according to the connection diagrams above. | |
| | 2. Set F-95 to in the configuration Page 98 settings to 0 (Enable). This will allow the external control of shutdown. | |
| | 3. Press the function key and confirm the new configuration settings. | |
| | 4. The switch will now shut down the power supply when shorted. | |

When using a switch over long distances, please use a switch relay to extend the line from the coil side of the relay.

If a single switch control is to be used for Multiple units, please isolate each instrument. This can be achieved by using a relay.

Warning

Ensure the cables and switch used exceed the isolation voltage of the power supply. For example: insulation tubes with a withstand voltage higher than the power supply can be used.

Remote Monitoring

The PSW power supplies have remote monitoring support for current and voltage output. They also support monitoring of operation and alarm status.

- External monitoring of output voltage and current → from page 117
- External monitoring of operation mode and alarm status → from page 119

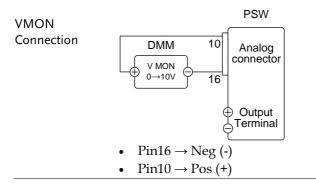

| External Voltage and | Current Monitoring |
|----------------------|---------------------------|
|----------------------|---------------------------|

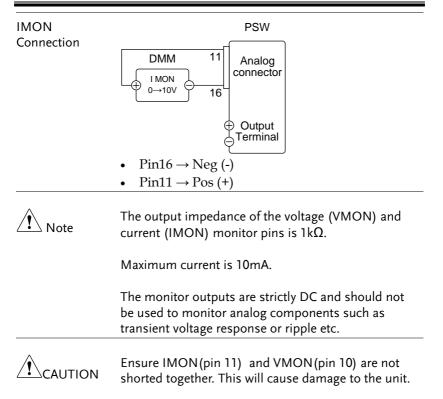

| Background | The MIL 26 pin connector is used to monitor the | | |
|------------|---|--|--|
| | current (IMON) or voltage (VMON) output. | | |

An output of 0~10V represents the voltage or current output of 0~ rated current/voltage output.

- IMON = (current output/full scale) × 10
- VMON = (voltage output/full scale) × 10

External voltage and current monitoring doesn't need to be enabled in the configuration settings.

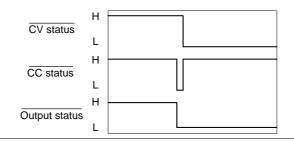

External Operation and Status Monitoring

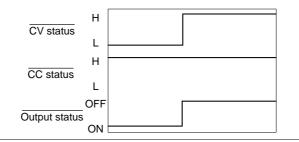

| Background | 1 | ector can also be used to eration and alarm status of | |
|------------|--|--|--|
| | The pins are isolated from the power supply internal circuitry by photo couplers. Status Com (Pin 17) is a photo coupler emitter output, whilst pins 18~22 are photo coupler collector outputs. | | |
| | A maximum of 30V ar each pin. | nd 8mA can be applied to | |
| | Name and Pin | Description | |
| | | Common (photo coupler emitter) for status signals 18, 19, 20, 21 and 22. | |
| | CV STATUS 18 | Low when CV mode is active. | |
| | | Low when CC mode is active. | |
| | | Low when any of the protection modes are tripped (OVP, OCP). Active low. | |
| | OUT ON 21 STATUS | Low when the output is on. | |
| | PWR OFF 22 STATUS | Active low. | |
| | | Pins 18, 19, 20, 21, 22 17 | |

Timing diagrams Below are 4 example timing diagrams covering a number fo scenarios. Note that pins 18~22 are all active low.

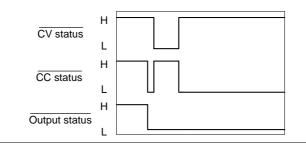

CV MODE: The diagram below shows the timing diagram Output turned on when the output is turned on when the PSW is set to CV mode.

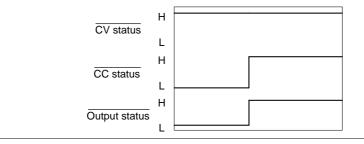

CV MODE: The diagram below shows the output status lines Output turned off when the output is turned off in CV mode.

CC MODE: The diagram below shows the timing diagram Output turned on when the output is turned on when the PSW is set to CC mode.

CC MODE: The diagram below shows the output status lines Output turned off when the output is turned off in CC mode.

COMMUNICATION INTERFACE

This chapter describes basic configuration of IEEE488.2 based remote control. For a command list, refer to the programming manual, downloadable from GW Instek website, www.gwinstek.com

| Interface Configuration | 123 |
|---|-----|
| Configure USB Remote Interface | 123 |
| Configure GPIB Interface | 123 |
| Configure Ethernet Connection | 125 |
| Web Server Configuration | |
| Sockets Server Configuration | |
| USB Remote Control Function Check | |
| Using Realterm to Establish a Remote Connection | |
| GPIB Remote Control Function Check | |
| Web Server Remote Control Function Check | |
| Socket Server Function Check | |

Interface Configuration

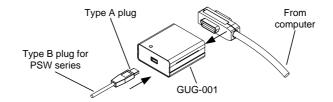

Configure USB Remote Interface

| USB configuration | PC side connector | Type A, host |
|----------------------|---|---|
| | PSW side connector | Rear panel Type B, slave |
| | Speed | 1.1/2.0 (full speed/high speed) |
| | USB Class | CDC (communications device class) |
| Panel operation | 1. Connect the U panel USB B p | SB cable to the rear ort. |
| | 2. Press the Function key to enter the Normal configuration settings. | |
| | F - 1 / 1 = 1 | USB settings: Set the rear panel USB port to USB-CDC. |

Configure GPIB Interface

| Background | To use GPIB, the optional GPIB to USB (GUG-001) adapter must be used. The GPIB to USB adapter must be connected before the PSW is turned on. Only one GPIB address can be used at a time. |
|----------------|--|
| Configure GPIB | 1. Ensure the PSW is off before proceeding. |
| | 2. Connect the USB cable from the rear panel USB B port on the PSW to the USB A port on the GPIB to USB adapter. |

3. Connect a GPIB cable from a GPIB controller to the GPIB port on the adapter.

- 4. Turn the PSW on.
- 5. Press the Function key to enter the Normal configuration settings.

Set the following GPIB settings:

| F-22 = 1 | Set the real panel USB port to USB Host. |
|--------------------|--|
| $F-23 = 0 \sim 30$ | Set the GPIB address (0~30) |

GPIB constraints • Maximum 15 devices altogether, 20m cable length, 2m between each device

- Unique address assigned to each device
- At least 2/3 of the devices turned On
- No loop or parallel connection

Configure Ethernet Connection

The Ethernet interface can be configured for a number of different applications. Ethernet can be configured for basic remote control or monitoring using a web server or it can be configured as a socket server.

The PSW Series supports both DHCP connections so the instrument can be automatically connected to an existing network or alternatively, network settings can be manually configured.

| Ethernet configuration | MAC Address (display only) | LAN |
|---------------------------|----------------------------|--------------------------|
| | DHCP | IP Address |
| Parameters | Subnet Mask | Gateway |
| | DNS Address | Sockets Active |
| | Web Server Active | Web Password Active |
| | Web set password | 0000~9999 (default 0000) |

Web Server Configuration

| Configuration | This configuration example will configure the PSW as a web server and use DHCP to automatically assign an IP address to the PSW. | |
|---------------|---|--|
| | | Ethernet cable from the LAN the rear panel Ethernet |
| | Press the Function key to enter the Normal configuration settings. Set the following LAN settings: | |
| | | |
| | F-36 = 1 | Enable LAN |
| | F-37 = 1 | Turn DHCP to enable |
| | F-59 = 1 | Turn the web server on |

| Note Note | | ary to cycle the power or refresh the onnect to a network. |
|------------------|---------------------------------------|--|
| Sockets Server C | Configuration | |
| Configuration | This configuration PSW sockets ser | on example will configure the ver. |

| | | Ethernet cable from the LAN ne rear panel Ethernet |
| | | nction key to enter the iguration settings. |
| | 3. Set the follow | ving LAN settings: |
| | F-36 = 1 | Enable LAN |
| | F-37 = 0 | Disable DHCP |
| | F-39 = 172 | IP Address part 1 of 4 |
| | F-40 = 16 | IP Address part 2 of 4 |
| | F-41 = 5 | IP Address part 3 of 4 |
| | F-42 = 133 | IP Address part 4 of 4 |
| | F-43 = 255 | Subnet Mask part 1 of 4 |
| | F-44 = 255 | Subnet Mask part 2 of 4 |
| | F-45 = 128 | Subnet Mask part 3 of 4 |
| | F-46 = 0 | Subnet Mask part 4 of 4 |
| | F-43 = 172 | Gateway part 1 of 4 |
| | F-44 = 16 | Gateway part 2 of 4 |
| | F-45 = 21 | Gateway part 3 of 4 |
| | F-46 = 101 | Gateway part 4 of 4 |
| | F-57 = 1 | Enable Sockets |

Note The socket function is supported only in PSW firmware version V1.12 or later. However, the socket function is supported in all firmware versions of PSW-Multi.

USB Remote Control Function Check

| Functionality check | Invoke a terminal application such as Realterm. The PSW will appear as a COM port on the PC. |
|------------------------|--|
| | To check the COM port No, see the Device Manager in the PC. For WinXP; Control panel \rightarrow System \rightarrow Hardware tab. |
| Note | If you are not familiar with using a terminal application to send/receive remote commands via a USB connection, please page 128 for more information. |
| | Run this query command via the terminal after the instrument has been configured for USB remote control. |
| | *idn? |
| | This should return the Manufacturer, Model number, Serial number, and Firmware version in the following format. |
| | GW-INSTEK, PSW30-36,TW123456,01.00.20110101 |
| | Manufacturer: GW-INSTEK |
| | Model number : PSW30-36 |
| | Serial number : TW123456 |
| | Firmware version : 01.00.20110101 |
| Note | For further details, please see the programming manual, available on the GW Instek web site @ www.gwinstek.com. |

Using Realterm to Establish a Remote Connection

| Background | Realterm is a terminal program that can be used to communicate with a device attached to the serial port of a PC or via an emulated serial port via USB. | |
|------------|---|--|
| | The following instructions apply to version 2.0.0.70. Even though Realterm is used as an example to establish a remote connection, any terminal program can be used that has similar functionality. | |
| Note | Realterm can be downloaded on Sourceforge.net free of charge. | |
| | For more information please see http://realterm.sourceforge.net/ | |
| Operation | 1. Download Realterm and install according to the instructions on the Realterm website. | |
| | 2. Connect the PSW via USB. | |
| | Go to the Windows device manager and find the COM port number for the connection. For example, go to the Start menu > Control Panel > Device Manager | |
| | Double click the <i>Ports</i> icon to reveal the connected serial port devices and the COM port for the each connected device. | |
| | The baud rate, stop bit and parity settings can be viewed for the virtual COM port by right- clicking connected device and selecting the <i>Properties</i> option. | |

| Network adapters | | | |
|---|---|--|--|
| Portable Devices | | | |
| Ports (COM & LPT) | | | |
| PSW (COM Processors Smart card rea Sound, video a System device | Ugdate Driver Software Disable Uninstall Scan for hardware changes | | |
| Universal Seria | | | |
| · | P <u>r</u> operties | | |

4. Start Realterm on the PC as an administrator. Click:

Start menu>All Programs>RealTerm>realterm

Tip: to run as an administrator, you can right click the Realterm icon in the Windows Start menu and select the *Run as Administrator* option.

5. After Realterm has started, click on the *Port* tab.

Enter the *Baud*, *Parity*, *Data bits*, *Stop bits* and *Port* number configuration for the connection.

The *Hardware Flow Control, Software Flow Control* options can be left at the default settings.

Press Open to connect to the PSW.

| a RealTerm | Serial Capture Program 2.0.0.70 | |

| | Bepeats 1 🗘 0 |

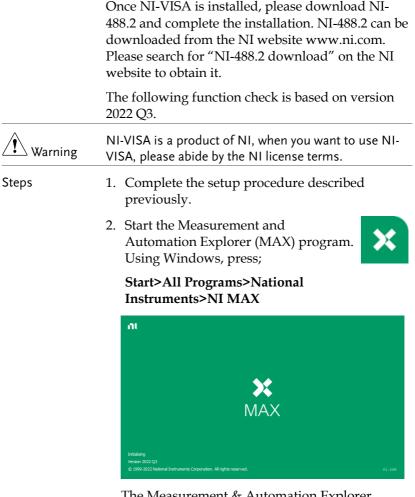

7. The terminal display will return the following: *GW-INSTEK*,*PSW*250-9,,01.54.20140313

(manufacturer, model, serial number, version)

8. If Realterm fails to connect to the PSW, please check all the cables and settings and try again.

GPIB Remote Control Function Check

| Background | To check if the GPIB connection is functioning properly, you can use the National Instruments Measurement and Automation Explorer (NI MAX). NI MAX needs to be obtained by installing NI-VISA. |
|------------|--|
| | You can download NI-VISA from the NI website www.ni.com. Please search for "NI-VISA download" on the NI website to obtain it. |

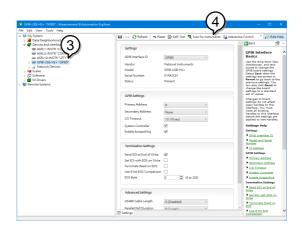

The Measurement & Automation Explorer initial splash screen.

3. From the **Configuration** panel access;

My System>Devices and Interfaces>GPIB0(GPIB-USB-HS+)

4. Press the Scan for Instruments button.

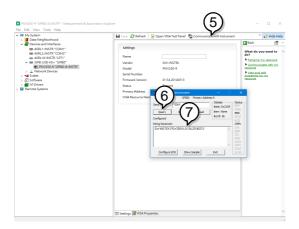

- 5. Click on Communicate with Instrument.
- 6. In the **NI-488.2 Communicator** window, ensure **IDN?* is written in the **Send String:** text box.

Click on the **Query** button to send the **IDN?* query to the oscilloscope.

7. The **String Received** text box will display the query return:

*GW-INSTEK,PSW*250-9,,01.54.20140313\n (manufacturer, model, serial number, version)

8. The function check is complete.

Web Server Remote Control Function Check

| Functionality check | Enter the IP address of the power supply in a web browser after the instrument has been configured as a web server (page 125). | | | | | |
|------------------------|--|--|--|--|--|--|
| | http:// XXX.XXX.XXX.XXX | | | | | |
| | The web browser interface appears. | | | | | |
| Note | For further details, please see the programming manual, available on the GW Instek web site @ www.gwinstek.com. | | | | | |

Socket Server Function Check

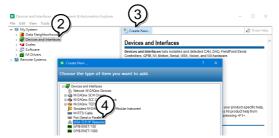

| Background | To check if the socket server connection is functioning properly, you can use the National Instruments Measurement and Automation Explorer (NI MAX). NI MAX needs to be obtained by installing NI-VISA. | | | |
|------------------------|---|--|--|--|
| | You can download NI-VISA from the NI website www.ni.com. Please search for "NI-VISA download" on the NI website to obtain it. | | | |
| | The following function check is based on version 2022 Q3. | | | |
| Warning | NI-VISA is a product of NI, when you want to use NI- VISA, please abide by the NI license terms. | | | |
| Functionality check | 1. Start the NI Measurement and Automation Explorer (MAX) program. Using Windows, press: | | | |
| | Start>All Programs>National Instruments>Measurement & Automation | | | |

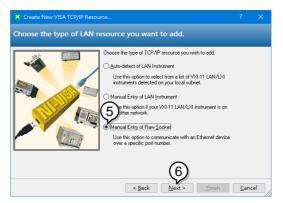

2. From the Configuration panel access;

My System>Devices and Interfaces>Network Devices

- 3. Click Create New....
- 4. Select Visa TCP/IP Resource.

- 5. Select *Manual Entry of Raw Socket* from the popup window.
- 6. Click Next.

- 7. Enter the IP address and the port number of the PSW. The port number is fixed at 2268.
- 8. Click the Validate button. A popup box will appear when successful.
- 9. Click Next.

| × Create New VISA TCP/IP Resource | | | | | |
|-----------------------------------|---|--------------|----|--|--|
| Enter the LAN resource de | etails. | | | | |
| | Enter the TCP/IP address of your VISA network resource in the tom of xxx xxx xxxxx. the hostname of the device, or a computer@some.domain | | | | |
| | 9 | | | | |
| | < <u>B</u> ack <u>N</u> ext > <u>F</u> inish | <u>C</u> anc | el | | |

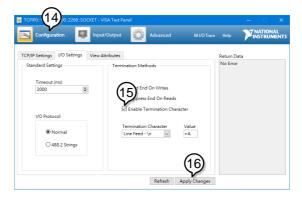

- 10. Next configure the Alias (name) of the PSW connection. In this example the Alias is: PSW_DC1
- 11. Click finish.

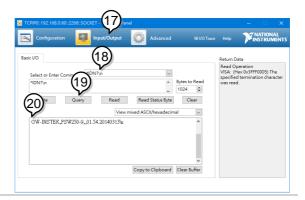

12. The IP address of the PSW will now appear under Network Devices in the configuration panel. Select this icon now. 13. Press Open VISA Test Panel.

- 14. Click Configuration icon.
- 15. In the *I/O Settings* tab, select the *Enable Termination Character* check box. Ensure *Line Feed* \n is selected as the line feed character.
- 16. Click Apply Changes.

- 17. Click the Input/Output icon.
- 18. Ensure **IDN*?*n* is selected in the *Select or Enter Command* dropdown text box.
- 19. Click the *Query* button.
- 20. The *IDN? query should be returned to the buffer area: *GW-INSTEK,PSW*250-9,,01.54.20140313*n*

For further details, please see the programming manual, available on the GW Instek web site @ www.gwinstek.com.

The PSW power supply filters should be replaced on a periodic schedule to maintain performance and specification characteristics.

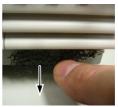

| Replacing the Dust Filter | |
|---------------------------|--|
|---------------------------|--|

Replacing the Dust Filter

The dust filter should be replaced at least 2 times a year. Not replacing the filter on a regular basis will reduce performance and may cause the unit to overheat.

Front panel filter 1. Turn the instrument off. (all models)

2. Pull the filter out from the bottom of the front panel.

3. Replace the filter with GW Instek part number 57RG-30B03801.

Faq

- The power supply won't let me change the mode (C.V. mode \leftrightarrow C.C. mode).
- The OVP voltage is triggered earlier than expected.
- Can I combine more than 1 cable together for the output wiring?
- The accuracy does not match the specification.

The power supply won't let me change the mode (C.V. mode \leftrightarrow C.C. mode).

To set the power supply to CC or CV mode, the Function key must be held when the power is turned on to enter the Power On Configuration Mode. See page 98.

The OVP voltage is triggered earlier than expected.

When setting the OVP voltage, take into account the voltage drop from the load cables. As the OVP level is set from the output terminals and not the load terminals, the voltage at the load terminals may be slightly lower.

Can I combine more than 1 cable together for the output wiring?

Yes. Cables can be used together (in parallel) if the current capacity of a single cable is insufficient. However the withstand voltage should also be taken into account. Ensure the cables are twisted together and are the same length. The accuracy does not match the specification.

Make sure the device is powered On for at least 30 minutes, within $+20^{\circ}C^{+}30^{\circ}C$. This is necessary to stabilize the unit to match the specification.

For more information, contact your local dealer or GWInstek at www.gwinstek.com / marketing@goodwill.com.tw.

- On Data log page, user can set data log function to record the output voltage and output current by period sampling time and counter setting.
- For usage of data log record function, please follow the setting description.

Sample Period: Set the sampling period. It can be set from 1sec to 600sec.

Maximum Number: Set Maximum counter numbers. It can be set from 100 to 60000 counters.

CSV Separator: Before start data log record, User can choose comma (,) or semicolon (;) for CSV separator to generate report.

Decimal Separator: Before start data log record, User can choose point (.) or comma (,) for Decimal separator to generate report.

Mode: When the data log reaches the maximum counter number settings, user can choose overwrite or stop the data log record.

No.: Number of data log counter.

Voltage: measurement voltage value.

Current: measurement current value.

OPER. Status: Value of operation Status Register. Please refer to programming manual for a detail description.

QUES. Status: Value of questionable Status Register Value. Please refer to programming manual for a detail description.

Time: Time of Data log record.

 $^{\ast 1}$ At 85 \sim 132Vac or 170 \sim 265Vac, constant load.

^{*2} From No-load to Full-load, constant input voltage. Measured at the sensing point in Remote Sense.

*³ Measure with JEITA RC-9131B (1:1) probe

*4 Measurement frequency bandwidth is 10Hz to 20MHz.

*⁵ Measurement frequency bandwidth is 5Hz to 1MHz.

*6 From 10% to 90% of rated output voltage, with rated resistive load.

*7 From 90% to 10% of rated output voltage, with rated resistive load.

*8 Time for output voltage to recover within 0.1% + 10mV of its rated output for a load change from 50 to 100% of its rated output current.

^{*9} For load voltage change, equal to the unit voltage rating, constant input voltage.

PSW-720

| Input Characteristics | | |
|--------------------------|----|---|
| Nominal input rating | | 100Vac to 240Vac, 50Hz to 60Hz, single phase |
| Input voltage range | | 85Vac ~ 265Vac |
| Input voltage range | | 47Hz ~ 63Hz |
| Maximum input current | | |
| 100Vac | А | 10 |
| 200Vac | Α | 5 |
| Inrush current | | Less than 50A. |
| Maximum input power | VA | 1000 |
| Power factor | | |
| 100Vac | | 0.99 |
| 200Vac | | 0.97 |
| Hold-up time | | 20ms or greater |
| Interface Capabilities | | |
| USB | | TypeA: Host, TypeB: Slave, Speed: 1.1/2.0, |
| | | USB Class: CDC (Communications Device |
| | | Class) |
| LAN | | MAC Address, DNS IP Address, User |
| | | Password, Gateway IP Address, Instrument IP Address, Subnet Mask |
| GPIB | | Optional: GUG-001 (GPIB to USB Adapter) |
| Environmental Conditions | | Optional. GOG-001 (GPIB to OSB Adapter) |
| Operating temperature | | 0°C to 50°C |
| Storage temperature | | -25°C to 70°C |
| Operating humidity | | 20% to 85% RH; No condensation |
| Storage humidity | | 90% RH or less; No condensation |
| Altitude | | Maximum 2000m |
| General Specifications | | |
| Weight (main unit only) | kg | Approx. 5.4kg |
| Dimensions (W x H x D) | | 142 x 124 x 350 |
| Cooling | | Forced air cooling by internal fan. |
| EMC | | Complies with the European EMC directive for |
| | | Class A test and measurement products. |
| Safety | | Complies with the European Low Voltage |
| | | Directive and carries the CE-marking. |
| Withstand voltage | | Between input and chassis: No abnormalities |
| - | | at 1500 Vac for 1 minute. |
| | | Between input and output: No abnormalities |
| | | at 3000 Vac for 1 minute. |
| | | |

| | Between output and chassis: No abnormalities at 500 Vdc for 1 minute for 30V, 40, 80V, 160V models. No abnormalities at 1500 Vdc for 1 minute for 250V, 800V models. |
|-----------------------|--|
| Insulation resistance | Between input and chassis: 500 Vdc, 100M Ω or more |
| | Between input and output: 500 Vdc, 100M Ω or more |
| | Between output and chassis: 500 Vdc, 100M Ω or more for 30V, 40V, 80V, 160V and 250V models. 1000Vdc, 100M Ω or more for 800V models. |
